**INVESTIGATION INTO THE DEPOSITION TECHNIQUES AND
COATINGS FOR SOLAR THERMAL AND PHOTOVOLTAIC
COLLECTORS**

ABSTRACT

The project addresses the significance of selective surfaces in the context of photovoltaic and solar thermal systems. Various selective surfaces are now in commercial use and several methods of preparing selective surfaces have been developed which depend on various mechanisms, compositional and microstructural characteristics to control selectivity. All the aforementioned parameters will be shown by example and a novel deposition method of nanostructured powders will be introduced. Nanostructured coatings can accommodate a wide spectrum of compositional constituents with unique microstructural features.

The initiation of this project falls within the activities of the Nanomaterials Research Center (NRC), a newly established center at HTI which serves as a bridge for technology transfer between HTI and the technology users (industry at large). The primary mission of NRC is to develop new methods for the economical production of nanostructured metals, ceramics, and their composites.

Current research is focused on methods for the production of nanostructured powders, nanophase coatings (wear resistant surfaces, thermal barriers, solar cell fabrications, selective surfaces) and nanophase composites (gas turbine engines, bulletproof vests).

Under this center, two operating divisions have been established, each with its own application goal(s) and commercialization strategy: (1) nanopowder synthesis, which is commercializing high rate production of non-agglomerated nanoparticles and (2) large area deposition of coatings. Both of the divisions focus on the commercialization of advanced materials processes for enhanced mechanical and thermal properties.

ACKNOWLEDGEMENTS

I would like to express my appreciation to Dr I. Michaelides, Senior Lecturer at the H.T.I. and Dr N. Angastiniotis, Lecturer at the H.T.I. for their guidance and assistance during the preparation of this work.

Introduction 1
CHAPTER I: PHOTOVOLTAIC AND SOLAR THERMAL COLLECTORS.3
1.1 Photovoltaic Collector Types..... 3
1.2 Solar thermal Collector Types..... 3
CHAPTER II: HOW SOLAR CELLS WORK..... 5
2.1 Using Silicon to convert photons to electrons..... 6
2.2 A deeper look into the Silicon cell..... 7
2.3 How does a PV cell then generate electricity? 8
2.4 What other materials can be used for a PV cell other than silicon?12
2.5 Powering a house 13
2.6 Encountered Problems and their possible solutions..... 14
2.7 Batteries..... 15
CHAPTER III: SOLAR THERMAL COLLECTORS..... 18
3.1 General Description 18
3.2 Collectors 18
CHAPTER IV: SELECTIVE SURFACES 23
4.1 General 23
4.2 Deposition methodology, compositions and associated mechanisms..25
4.2.1 Metal oxides on metal substrates 25
4.2.2 Semiconductor coatings with antireflective surfaces..... 26
4.2.3 Grooved or pitted surfaces..... 27
4.2.4 Directional selectivity..... 27
4.2.5 Microstructural control..... 28
4.2.6 SS-C and Al-N cermet solar collector tubes 28
4.2.7 Mo-Al ₂ O ₃ cermet solar collector tubes for solar thermal electricity....29
4.2.8 Recent research achievements..... 30
4.2.9 Double cermet layer structure of solar selective coatings..... 31
4.2.10 M-AlN cermet solar coatings by a novel two-target dc sputtering....32
4.2.11 Commercial development..... 36

4.2.12	Al-N cermet solar coatings with double cermet layer strucure.....	36
4.2.13	SS-AlN cermet solar coatings by two-target dc sputtering.....	38
4.2.14	W-AlN cermet solar coating by two-target dc sputtering.....	41
4.2.15	CLFR reflector for solar thermal electricity.....	42
CHAPTER V: COATING AND DEPOSITION PROCESS.....		44
5.1	General Overview.....	44
5.2	Small Area Coating Processes.....	45
5.2.1	Electroplating.....	45
5.2.2	Electroforming.....	45
