## **ACKNOWLEDGEMENTS**

I would like to thank all people who helped me gather all the information needed to complete and suggested methods of presenting this project as good as possible.

Special thanks to my project supervisor, Mr. Sotos Voskarides, lecturer in the Electrical Engineering Department of H.T.I, for his valuable guidance and assistance for the completion of this project.

# **CHAPTER 1**

## **INTRODUCTION**

The scope of this project is to gather information about how robotics can be applied in telemedicine. This research includes simple and technical information on how this can be done.

The purpose of this system is to help people living in remote areas get the medical help they need from doctors all around the world, without the time and money consuming need to travel long distances.

This project includes information on how people can take advantage of the vast capabilities of robotics and wireless technology, for the sake of medicine.

# CHAPTER 2

## WIRELESS TECHNOLOGIES

### **2.1 INTRODUCTION**

Wireless technologies represent a rapidly emerging area of growth and importance for providing ubiquitous access to the network for all of the campus community. Students, faculty and staff increasingly want un-tethered network access from general-purpose classrooms, meeting rooms, auditoriums, and even the hallways of campus buildings. There is interest in creating mobile computing labs utilizing laptop computers equipped with wireless Ethernet cards. Recently, industry has made significant progress in resolving some constraints to the widespread adoption of wireless technologies. Some of the constraints have included disparate standards, low bandwidth, and high infrastructure and service cost. Wireless technologies can both support the institution mission and provide cost-effective solutions. Wireless is being adopted for many new applications: to connect computers, to allow remote monitoring and data acquisition, to provide access control and security, and to provide a solution for environments where wires may not be the best solution.

What follows is an overview of existing wireless technologies and related issues.
