1 Introduction

The Stock Control System Sales & Purchases, is a complete tool that provides user the ability to maintain easily and fast enough its stock.

Well, this stock control system is not going to be used by a specific organization or company. Generally, the background of the user of this stock control system would be any storehouse, dealing with any product, such as: shoes, clothes, computers, paints, accessories, cars, parts and many others.

However the system would not support storehouses dealing with medicines or food. To be more specific, this system is not going to support products that have expiration dates.

The system keeps full description of all items in stocks that may involve serial numbers, item short-description, color, quantity, price, and others, depending on the product that storehouse supplies.

It provides the ability to know at any time, anything about the stock movement. System will keep track of any in-come and out-come item and manage transactions.

The stock control system is also going to help the storehouse managing sales and purchases, invoicing and orders.

This system would deal with many other facts like: sales returns, damaged items, mistakes that may come out after delivery, etc.

Even though the system is very easy to learn , this “User’s Manual” book is going to make it even more easier for you to understand and operate.
