# FM STEREO TRANSMITTER

by N. VALIANTIS

## SUMMARY

The use of telecommunication methods in the broadcasting services during the last years, offered the opportunity to quality listener to enjoy stereo FM broadcasting transmission.

FM can be produced by a lot of ways. The best may is by a phase lock loop frequency synthesizer which give the best stability.

A combination of a stereo encoder with a P.L.L. gives you the best result of transmitting quality and this is what this project is going to deal with. How to transmit quality.

## CONTENTS

	Page
Acknowledgements	
Summary	
- CHAPTER I : STEREOPHONIC FM MULTIPLEX SYSTEM	
1.1. General Information	1
1.2. Stereo transmission	1
1.3. Technical characteristic	5
CHAPTER II : FREQUENCY MODULATION	
2.1. General Information	6
2.2. Description of systems	6
2.3. Mathematical representation of FM	8
2.4. The FM SPECTRUM	11
2.5. Broadband FM	13
2.6.1. General	14
2.6.2. Methods	15
2.6.3. Directo methods	16
2.6.4. Stabilized reactance modulator - A.F.C.	18
2.6.5. Indirect method	19
CHAPTER III : NOISE	
3.1. General Information	20
3.2. Interference	20
3.3. Noise	22
CHAPTER IV :- R.F. SYNTHESIZER (P.L.L.)	
4.1. General Information	26
4.2. Functional principle	29
4.3. How to tune a frequency	32
4.4. Technical characteristics	37
CHAPTER V :- LINEAR	
	38
