## **Introduction**

DJ Software System is a program which is made for a small DJ company and has a lot of options who can help a manager of having a general control of the company. It has five parts which are Employees , Equipment , Incomes / Outcomes , Advertisements and Schedule.

Each of this parts has a list where data are shown and some buttons so to add or edit any data you want. They are very common with small differences so its not hard to learn the system.

The system was build with Visual Basic 6.0 and with MS Access.

In this manual I will show you how to act with any button and what each button does.
