IDENTIFICATION OF RESTRICTION ENDONUCLEASE  
SITES IN DNA SEQUENCES

BY

ROUVIM OLGA

SUMMARY

The purpose of this system is to computerize the process of identifying restriction endonuclease sites in DNA sequences. The idea was derived from the need, of the geneticists in the Cyprus Institute of Neurology and Genetics, to keep all the enzyme records, to search for their sites in any DNA sequence and to produce reports, concerning the searching.

The basic objective of this project, was to develop a system that would be user-friendly and efficient, to fulfill the need of having results without any delays.

The first phase of the project, was the INVESTIGATION phase. Processing, carried out manually, was studied, and the feasibility of the project, was decided upon.

The second phase, was the ANALYSIS AND GENERAL DESIGN phase. System Specifications were extracted, along with the specified needs of the Institute. Also, a preliminary outline of the computerized system was designed.

The third phase, was the DETAILED DESIGN AND IMPLEMENTATION phase, during which, the new system was designed with every detailed aspect. Also, the system was fully tested in order

to meet the user performance criteria.

For the last, INSTALLATION phase, the developed system, was installed on the existing hardware.
