# 1 INTRODUCTION

## 1.1 Overview

This User Manual gives guidance in installing the new system over an existing system. It provides all the necessary steps that need to be performed in order for the final system to be functional.

Here you can also find the installation processes that will explain in detail what needs to be done to setup the system. Additional tasks are also explained such as backup sequences and of course the system's new additions. All the modifications are also explained in two different levels; the programmer's view and the CCS administrator's view. This will guide any programmer for future modifications on the system.
