PEAK SIGNAL DETECTOR

PROJECT NUMBER : E/887

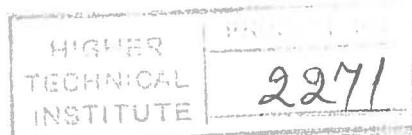

PROJECT REPORT SUBMITTED BY : Cleanthous Constantinos

In partial satisfaction of the award of diploma  
of technician engineer in ELECTRICAL ENGINEERING  
of the HIGHER TECHNICAL INSTITUTE  
CYPRUS

Project Supervisor : Mr. S.P. Spyrou  
BSc(Eng) CEng  
MIEE FIHospE

External Assessor : Dr. C.S. Pattichis  
BSc(Eng) MSc(Eng) PhD(Eng)

#### **ACKNOWLEDGMENTS**

I would like to express my thanks to my project supervisor Mr. S.P. Spyrou for his guidance throughout the project period and especially to Dr. C.S. Pattichis for his most helpful assistance and guidance, in order to finish successfully this project.

Also I would like to express my thanks to the staff of the Cyprus Institute of Neurology and Genetics.

## INTRODUCTION

### PEAK SIGNAL DETECTOR

By : CLEANTHOUS CONSTANTINOS

The objective of this work was to analyse the electrical activity of muscle reached at different levels of force. The electromyographic (EMG) signal was reached, using the concentric needle electrode, from the biceps branchii muscle at 10%, 30%, 50%, 70%, and 100% of maximum voluntary contraction.

The signal is analysed in the time domain by extracting the parameters ; number of zero crosses, and mean amplitude between peaks. In this project power spectrum analysis is introduced as a possible way of analysing the EMG signal.
