LOAD ANALYSIS AND LOAD FLOW ANALYSIS ON THE KATO PAPHOS
AREA NETWORK. INVESTIGATION OF THE SYSTEM CONDITIONS AND
OPTIMIZATION.

TABLE OF CONTENTS **Page**

ACNOWLEDGEMENTS	i
SUMMARY	ii
INTRODUCTION	iii

1. CHAPTER ONE: THE ELECTRICITY AUTHORITY OF CYPRUS

1.1	Introduction	1
1.1.2	The existing generation system	1
1.2.1	System Development of Urban Areas	2
1.2.2	Procedure of the System Studies	3

2. CHAPTER TWO : BASIC CONCEPTS

2.1	The Per Unit System	5
2.1.1	Useful Relationships	6
2.1.2	Changing the Base	6
2.2	Busbars	7
2.2.1	Slack Busbars	7
2.2.2	PQ	7
2.2.3	PV	7

3. CHAPTER THREE : TRANSMISSION AND DISTRIBUTION IN CYPRUS

3.1.1	Mode of Operation	8
3.1.2	Auto Transformer	9
3.2	System Parameter	10
3.2.1	Fuses	10
3.2.2	Ring Main Unit	10
3.3.1	Switches	11

3.3.2	Circuit Breakers	11
3.3.3	Relays	11
3.4.1	Current Transformers	12
3.4.2	Voltage or Potential Transformers	12

CHAPTER FOUR : POWER SYSTEM COMPONENTS

4.1	The Nature of Component Modelling	13
4.2	Basic System Components Modelling	14
4.2.1	Transmission Networks	14
4.2.2	Transmission Lines	14
4.2.3	Classification of Transmission	14
	- Π equivalent	15
	- T equivalent	15
4.3.1	Loads	16

CHAPTER FIVE : THE LOAD FLOW PROBLEM

5.1	Introduction	17
5.1.1	Nature of Load Flow Studies	17
5.2	Solution of the Load Flow Problem	18
5.2.1	Gauss-Seidel Method	19

CHAPTER SIX : THE POWER ANALYSIS PC APPLICATION

6.1	Introduction	21
6.1.1	General Characteristic of the Load Flow Studies	21
6.2	The Load Flow Option	23
6.2.1	General Features	23
6.2.2	Running the Load Flow Option	24

CHAPTER SEVEN : KATO PAPHOS SYSTEM ANALYSIS

7.1	Introduction	28
7.2	Procedure of System Analysis	29
7.2.1	Rate of Increase of Kato Paphos System Loads	29
7.2.2	Using PSA program	29

7.3	The Existing Kato Paphos System	30
7.4	Proposed Condition	31
7.4.1	Introduction	31
7.4.2	Fault Conditions	31
<u>CHAPTER EIGHT : CONCLUSION</u>		34

REFERENCES

APPENDICES

APPENDIX 1 : Studies of System Condition of Kato Paphos

APPENDIX 2 : Basic Concepts in the PSA Program.

The Load Flow Module

APPENDIX 3 : Load Flow Files

APPENDIX 4 : Single Line Diagrams

APPENDIX 5 : General Information

APPENDIX 6 : The New Transmission Substation S/S (A.Xadjipasxalis)

ACKNOWLEDGEMENTS

The effort in expediting this project was not easy. Time consuming, guidance and supervision throughout the whole time were absolutely necessary.

My thanks are extended to Mr. Evangelos Anastassiades of EAC, external supervisor for his patience in guiding me where to search for the data and in advising and helping me a great deal for my work.

Furthermore, I would like to express my gratitude to my supervisor Mr. John Demetriou lecturer in the electrical department of H.T.I , whose help was substantial in putting all the substances in order, form them in a presentable way.

Moreover the support and understanding of my family when needed and the technical assistant of my closed beloved friend Michael in typing and formulating in a presentable manner the project is greatly appreciated and will not be forgotten. His tolerance and support for endless hours was very valuable and could not do without them.

Maria Parouti, June 1999

SUMMARY

LOAD FLOW ANALYSIS ON THE KATO PAPHOS AREA NETWORK INVESTIGATION OF THE SYSTEM AND OPTIMIZATION

by Maria Parouti

E.1197

The objective of this project is the reinforcement of the power network which is use for the electricity supply Kato Paphos area. In order to do that, we will study the main factors on which the existing power network works on, its limitations and the problems arising when it is in full needs or overloaded. The system needs to be examined when in operational conditions.

At first we will take the historical observations in the behaviour of the system in the area. Then, we will observe what will happen, at ten years time, when there is an overload, with regression analysis and we will estimate what would be the behaviour in the future. Consequently we will examine the system under several loading conditions in order to determine the point in time at which the system shall be unable to preserve stability and sustainable economical losses are attained.

Having done that, we will derive the point in time when reinforcement of the system is necessary for more effective use by establishing a new transmission substation in the area. Then we will look at the reinforced system and examine alternative medium voltage reinforcements that would make the new transmission substation as operative as possible. For presentation purposes in describing the excising and future system conditions detailed statistics graphs, as well as single line diagrams and topographic maps are used. Furthermore, throughout the project the POWER SYSTEM ANALYSIS (PSA PC APPLICATION) program is used in order to perform the above assignment without a lot of time waste.

INTRODUCTION TO THE PROBLEM

In the old years, Electricity Authority of Cyprus performed calculations by hand and possible modification that needed to take place in a system were based on approximate estimations. This work, obviously was tedious, hard and mistakes were very likely to occur. Thus the need arose in simplifying these procedures.

Furthermore, as power engineering needs huge capital investment, generating, transmitting and distribution of power by Electricity Authority of Cyprus had to be done in the most economical manner. Thus, over the years, as technological breakthroughs evolved, Electricity Authority of Cyprus took advantage of the newly established procedures for the establishment of system load flow studies. In order to deliver electric energy to the Cyprus consumer in the most economical manner, Electricity authority of Cyprus employs Load flow studies in the procedures of studies over the various areas of the island.

Load flow analysis is defined as the specification of basic network parameters that indicate the behaviour of the system under several loading conditions. These parameters are the real (MW) and reactive (MVar) power flows in the branches of the network, the voltage drops occurring at the nodes of the network, system losses, transformer tap settings etc. As a result, by investigating these parameters occurring under selected conditions, there may be clear specifications of possible modifications, that are essential to be made in the network in order to operate in a productive, and if possible, optimum manner. This is important, as by reducing the losses occurring in a network, automatically there is a reduction in the operating costs of the network.

The load flow analysis of a given network is one of the most important tasks to be performed, in order to specify the conditions occurring in the network during load variations, normal or abnormal situations and cases of fault.

In simulating the network parameters, at first, the network analyser was used in performing the necessary calculations and producing the wanted results. Although unreliable solutions and mistakes were reduced significantly the network analyser was not the most effective device, it was still found to be complicated and time-consuming. Thus, in solving the problem, a different approach was needed.

As a result, there was a dramatic change in digital equipment with the widespread use of computers in a vast range of applications. This evolution in digital equipment, enabled engineers to create programs which had the ability of analysing very large power systems and performing Load Flow studies effectively, accurately and most important, economically.

Nowadays Electricity Authority of Cyprus, utilises the Power System Analysis program (PSA package). It has the ability of performing Load Flow calculations and fault Level calculations as well. It may handle easily large power network, producing all necessary output data in no time. This establishes the PSA package as a powerful tool in the hands of every engineer.

As stated in the "Summary" section of this report, we use Load Flow module in the PSA package to simulate Kato Paphos area existing system. System conditions is studied, all system weak points are being identified and solutions are proposed in reinforcing the system.. Furthermore, the need in establishing a new transmission substation in the area is examined and the system conditions including the new substation is studied.
