.

A FEASIBILITY STUDY ON THE INTRODUCTION OF CAD/CAM IN METAL INDUSTRY

by Georgiou Christos

Project Report

Submitted to the Department of Mechanical Engineering

of the Higher Technical Institute

Nicosia Cyprus

in partial fulfillment of the requirements

for the diploma of

TECHNICIAN ENGINEER

in

MECHANICAL ENGINEERING

June 1996

CONTENTS

Acknowledgments Summary	
Introduction	page 1
CAD/CAM definition/applications/benefits e.t.c	3
Hardware of CAD/CAM	7
Input-Output devices	11
Communications and terminals	25
Software of CAD/CAM	25
Design process	27
CAPP, CAPC	29
NC-machines	31
CNC-machines	34
DNC-machines	35
Machine tools/operations and drive motors	36
Design and manuf. operations of a firm	38
Identify an area which a CAD/CAM system can be introduced	41
Feasibility study	41
Conclusions	49

Acknowledgments

I would like to delicate this project to the memory of my supervisor Mr. Marios Pattichis.

I would like to thank Mr. L.Lazari, Mr. P.Demetriou ,and any one helped me in this project.

I also thank Melina and Constantinos for helping me with the printing.

A FEASIBILITY ON THE INTRODUCTION OF CAD/CAM IN A METAL INDUSTRY Project number : M/763

Georgiou Christos

Summary

The main objective of this project was to introduce the subject of CAD/CAM in metal industry.

For understanding the technical aspects of CAD/CAM the computer technology (hardware and software) and peripherals were investigated as a part of CAD.

In the side of manufacturing some automated machines, drives, and different operations which can be used in CAD/CAM were necessary to be explained.

It was also have been discussed the effects of productivity and the changes that might be done to the manufacturing firm.

At the end of the project a particular firm was selected for describing it's design and manufacturing operations, identify an area which a CAD/CAM system should be introduced and make a feasibility study.

INTRODUCTION

In some areas of metal industry the process of machining components and parts was done by hand tools or manually operated machines.

In the last 35 years the technology has risen to a level that computers and modern machines have been introduced in different areas of industry and manufacturing plants.

Systems that are used to simplify the work and introduce automation in industry are the CAD/CAM systems. CAD/CAM systems are used for different purposes but have a lot of advantages but and disadvantages too.

For a company to install such a system it must make a a feasibility study to see if is really needed a CAD/CAM is really needed and what profits the company will make by the use of it.

Unfortunately for the employees sometimes the replacement of the human factor in some areas is not acceptable because one of the purposes of CAM/CAM is the reduction of manpower in the drawing office and the production line.

The technology of CAD/CAM systems has improved with time and provides more capabilities and the applications in many sections of industry are getting wider. The main purpose for a company to use a system is the increase of its productivity and its profit and for doing jobs that are difficult to perform.
