Type of project : Individual

June 1989

ABSTRACT

This project deals with the design construction and testing of a microprocessor that will prohibit the overseas calls. The whole system is capable of monitoring seven telephone lines and analyzes the numbers dialed in decade pulsing mode.

The system allows overseas calls if a certain 4 digit preallocated code is dialed correctly after the prefix "00".

CONTENTS

	Page
CHAPTER ONE INTRODUCTION	
1.1. System description	1
1.2. Summary of the requirements	2
CHAPTER TWO HARDWARE DESIGN	
2.1. General block diagram	4
2.2. The crossbar exchange	5
2.3. The microprocessor unit	7
2.3.1. The processor	7
2.3.2. The memory	8
2.3.3. Demultiplexing and addressing	10
2.3.4. The 8155 peripheral interface	10
2.3.5. Further MPU information	12
2.4. The interface	16
2.4.1. General block diagram	16
2.4.2. The monitor control unit	17
2.4.3. The reverse flow unit	21
2.4.4. The shunt and series controllers	22
2.5. The buffers	26
2.6. The watch dog circuit	26
2.7. Important note	28
CHAPTER THREE SOFTWARE DESIGN	
3.1. Introduction	30
3.2. General overview of the program	30

3.3. Software developing	34
3.3.1. Initialisations	34
3.3.2. Software debouncing	36
3.3.3. Validating and counting subroutines	41
3.3.4. The error subprogram	51
3.3.5. The error zero subprogram	53
3.3.6. The interd subprogram	53
3.3.7. The blink subroutine	54
3.4. Addresses and status registers	54
3.5. Multi tasking the system	55
3.6. Further initialisations	56
3.7. Locating the codes in ROM	70
CHAPTER FOUR TESTING AND TROUBLESHOOTING	
4.1. Testing the microprocessor unit	72
4.2. Testing the interface	73
4.3. Troubleshooting the interface	74
CHAPTER FIVE FUTURE EXPANSION	
5.1. Expanding the lines capability	78
5.2. Making the unit with programmable codes.	79
5.2.1. Hand set programming	79
5.2.2. Programming through the personal computer	79
