## ABSTRACT

Water supply related information has become increasingly important to the use and development of a water distribution network.

Originally, water supply related information is collected, updated and stored on a constant basis. With the introduction of modern technology, these activities are computerised through a system complying to the international standards.

The Nicosia Waterboard which is the state agency responsible for potable water, is embarked upon a program, the Supervisory Control and Data Acquisition System (SCADA), in order to improve the efficiency and effectiveness of the Departmental activities.

This project aims at presenting a proposed design and construction of a mimic diagram that will provide a simple at a glance visual presentation of the Nicosia water distribution network.

A microcontroller will give an efficient and practical solution to this specific problem.

This project covers in detail the communication of the microcontroller with a personal computer and the interfacing with a Liquid Crystal Display on which all important information will appear.

## ACKNOWLEDGEMENTS

I gratefully acknowledge the assistance of my supervisor, Mr Charalambos Theopemptou.

I wish to express my thanks to Mr Emilios Kapelides and Mr. Alekos Alexandrou for their valuable assistance.

I would also like to thank the staff of the Electrical Engineering Department of the Higher Technical Institute as well as the staff of the Resource and Type Approval Department of CYTA.

Thanks are also directed to Mr Kyriakos Kytilis whose help can not be neglected.

Special thanks must be given to Cyprus Telecommunications Authority and the Nicosia Waterboard which provided me with related information for this project and P&R Techconsult for their technical support.

My grateful thanks to all my colleagues in the course for their support and for making the year very enjoyable.

I especially owe a debt of considerable gratitude to my family for the love and support they have shown throughout the period of my academic studies.

## INTRODUCTION

The Water Board of Nicosia was established in 1953 and it was given the responsibility and utilization of potable water to the city of Nicosia.

Its service area includes all five municipalities of the greater Nicosia Metropolitan area, and today the Water Board of Nicosia supplies almost 200,000 people with 12,000,000m<sup>3</sup> of potable water, through 662Km of watermains, via 57,200 consumer connections.

It is well known that the Nicosia Waterboard adopted the today's modern water distribution system through continuous improvement and development which is according to the international standards.

The Water Board of Nicosia uses a Supervisory Control and Data Acquisition System (SCADA) for the proper management of the potable water supplies of Nicosia. Through the SCADA system all important information is available on a constant basis.

Forty area meters are part of the water distribution network and for all of them useful information is stored in a specific PC program.

The aim of such a project proposal was the need to provide a visual and simple presentation of the Nicosia water distribution network in such of form as it is easily understood by everyone.

In order to have a clear and fast understanding of the system it is proposed to use the help of a PC and a simple display system superimposed on the map of the actual network.

---

A dedicated software program in addition to a hardware design will enable the presentation of flow, pressure and other useful information in this simple display system.
